

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

the Jews still use them in some countries for the purpose of circumcision. This might account for the rude mode of construction; it may be conventional and archaic, perhaps prescribed by the ritual of Druidism. However, in this instance, the number found would appear to negative the supposition. They were probably intended for daily use, and the moss would serve to steady the hand and prevent its slipping."

---

Rev. Joseph A. Galbraith read a communication on the Apsidal Motion of a freely suspended Pendulum.

---

Sir William Rowan Hamilton entered into some explanatory details respecting the nature and properties of that ACONIC FUNCTION of six vectors, of which he had spoken in a recent communication with reference to a certain generalization or extension of Pascal's theorem, conducting to a relation between ten points on a surface of the second order.

In the Proceedings of the Royal Irish Academy for July 20, 1846, it was remarked by Sir W. Rowan Hamilton, that the theorem of Pascal might, in the calculus of quaternions, be expressed by the following general equation of cones of the second degree :

$$S . \beta \beta' \beta'' = 0,$$

where

$$\beta = V (V . a a^I . V . a^m a^{IV}),$$

$$\beta' = V (V . a^I a^m . V . a^{IV} a^V),$$

$$\beta'' = V (V . a^m a^{IV} . V . a^V a);$$

$a, a^I, a^m, a^{IV}, a^V, a^V$  being any six homoconic vectors, and the letters S and V being the characteristics of the operations of taking respectively the scalar and vector parts of a quaternion. Now it is precisely *that function* of six vectors  $a \dots a^V$ , which was thus denoted in that communication of 1846, by  $S . \beta \beta' \beta''$ , to which it has since appeared to Sir W. Rowan Hamilton
